We are excited to bring you information this coming week on a new national initiative from the suicide prevention resource center, it will be part of our webinar on Registries and Data Driven Care - See below for more information on this new opportunity as well as information on our other speakers!

The Zero Suicide Data Dashboard is a practical tool for healthcare organizations to set specific, measurable, achievable, realistic and timely Zero Suicide goals. The Zero Suicide Data Dashboard provides a systematic approach to monitoring progress in the ongoing effort to provide safe suicide care. This Dashboard serves as the first nationally accessible resource that tracks processes and outcomes that are related to the implementation of suicide-specific best practices.

#### Key Features

- **Progress Tracking Over Time:** The Dashboard empowers organizations to visualize the long-term effects of changes made within healthcare and behavioral health institutions.
- **Customization:** Organizations can tailor user accounts to customize data entry and ensure reports reflect their unique requirements.
- **Precise Progress Measurement:** Implementers can easily access and enter data, ensuring they are on track to achieving their Zero Suicide goals.
- **Identifying Successes and Areas for Improvement:** Implementers are encouraged to input data into the Data Dashboard every three months. This frequency allows for an in-depth examination of outcomes, which, in turn, helps organizations celebrate their successes and pinpoint areas that need improvement.
